

They'll Always Be Your Babies.

MAKE SURE YOUR TEENS GET A SECOND SHOT TO HELP PREVENT MENINGITIS.

Teenagers infected with meningococcal meningitis can face devastating consequences in less than 24 hours — and are at increased risk for this rare but potentially life-threatening disease. That's why the Centers for Disease Control and Prevention (CDC) recommends a second vaccination as early as age 16 — even if your teen was vaccinated at age 11 or 12 years.
